## Skier triggered small wind slab on Saddle Peak

Saddle Peak Bridger Range 12/23/2021 Code HS-ASc-R1-D1-I Elevation 9000 Aspect E Latitude 45.79430 Longitude -110.93600 Notes

We were able to intentionally <u>trigger</u> this 6-8" deep <u>wind slab</u> on Saddle Peak on December 23, 2021, E <u>aspect</u> at 9,000'. It showed us that recently formed wind slabs were still reactive. This hard <u>slab</u> formed over low density new snow which made it unstable. While not large, these slides will easily push you down and can be harmful if they push you into hazardous obstacles or terrain traps. - GNFAC
