

Old Crowns near Wheeler

Date

Sat, 02/11/2023 - 11:35

Activity

Skiing

While on a tour today up Wheeler gulch, we noticed a few old crowns that released before the most recent snow, hard to say if they were natural or not. We also observed a most likely remote triggered small wind slab (not our tracks next to it). Solar aspects were hot. Top of snowpack was relatively stable in our 4 foot pit, some collapse but no propagation (E aspect, 8400 feet).

Region

Northern Gallatin

Location (from list)

Wheeler Mountain
