

Very Touchy up Hyalite

Date

Sun, 03/03/2024 - 10:25

Activity

Skiing

Toured to the zipper for some 25° meadows and while the skiing was excellent, the stability was not. We triggered numerous thundering whumphs and got shooting cracks, the largest of which propagated at least 100' wide! See snow profile attached with test results.

Region

Northern Gallatin

Observer Name

Sam Lowe
